AJAX

AJAX project requirements

- The evaluated website is an extension of the previously prepared website

- The site uses PHP/JavaScript/Ajax technology to enrich the dynamic nature of the site

- Various solutions are possible, the degree of complexity of the solutions should correspond to the examples presented in class.

- Example solutions:
    - a) enriching the website form with a hint system (using various controls) generated on the basis of template files created on the server (preferably dynamically modified with a script)
    - b) enriching the module for editing and viewing the submissions of the current form with the functions of dynamic content filtering
